

Tech fixes for procurement problems?

Prof Albert Sanchez-Graells
Professor of Economic Law
UoBLS / GW Beyond the FAR
Bristol / Washington DC, 15 Dec 2022

BA project overview

*“Digital technologies and public procurement.
Gatekeeping and experimentation in digital
public governance”*

Two interrelated parts:

- Procurement of digital technologies
- Adoption of tech in procurement
(or procurement digitalisation)

The British Academy

bristol.ac.uk

Goal

To present preliminary findings on procurement digitalisation

Focus on:

- **Tech ‘policy irresistibility’**
- **‘True’ potential of tech in procurement**
- **Data and digital skills challenges**
- **Governance of tech risk-taking**

bristol.ac.uk

Tech ‘policy irresistibility’

**Procurement is an information-based activity
(information intensity and complexity)**

**Digital technologies are in principle/theory suited
to information-intensive activities**

**Hype and limited public sector capability
can result in ‘policy irresistibility’**

**This can lead to excessive experimentation
and adoption with long-term impacts
on (digital) public governance**

bristol.ac.uk

Realistic view on 'true' tech potential

We need to take a hard look at the enabling requirements and the realistic potential functionalities of the different digital technologies in the highly-regulated context of procurement governance

Focus on:

- **Robotic Process Automation**
- **Machine Learning**
- **Blockchain, Smart Contracts and Internet of Things**

RPA

The possibility to automate (parts of) the procurement process depends on being able to detail and code it

This excludes automation where discretion or open-ended criteria are concerned

Trade-off between automation and rigidity, so automation most likely for information gathering and cross-checks

bristol.ac.uk

ML

There are multiple ML potential applications, including 'smart' automation

Of particular interest:

- **Recommender systems**
(collective filtering vs content analysis)
- **Chatbots**
(FAQ closed-domain; expert systems)
- **Automated screens or red flags**
(‘intermediate’ level; explainability)
- **Automated tender processing**
(robot-robot tendering)

bristol.ac.uk

Blockchain, Smart Contracts and IoT

Most governance advantages would result from decentralisation, but the public sector is extremely unlikely to adopt that type of (permissionless, public) blockchain

Smart contracts have limited potential other than as a form of (limited) information exchange automation

IoT oracles would enhance functionality in limited (off-chain) settings

bristol.ac.uk

Tech feasibility boundary (plus: no data, no fun)

The potential functionality is much more limited than could have been expected, and primarily limited to information-intensive aspects of procurement, but not to those related to information complexity

Crucially, all technologies are data-dependent

Limited advances in (open) big data generation are single biggest constraint

'New' governance risks & challenges

In addition to the 'traditional' procurement governance challenges, and 'tech-supported' forms of new challenges (eg algorithmic corruption or collusion), there are new governance implications for the rollout of procurement digitalisation:

- **Data challenges**
- **Algorithmic and technological challenges**
- **Systemic challenges (eg cyber security)**
- **Digital skills challenges**

Data challenges

Data capture (at source)

Data curation

Data governance

- **Increasing set of obligations, even for 'tech-passive' public buyers**
- **'Open by default' a no-go in some jurisdictions (eg EU)**

bristol.ac.uk

Digital skills challenges

There is a growing gap in the public sector's digital capability

This is a meta-risk because it compounds other risks (-> unknown unknowns)

Short-term fixes to boost capability generate further long-term capability erosion plus additional governance challenges (eg organisational conflicts of interest)

Increasing awareness of the issue, but significant practical difficulties to sorting it

bristol.ac.uk

Tech risk-taking in procurement digitalisation

So far, mostly unregulated

Limited guidance and emerging model based on self-regulation and *undefined* self-assessment, ultimately generating suboptimal 'second party' assurance

**Need for external oversight ('third party')
—my proposal is for institutionalised oversight ('AIPSA' / EU AI Office)**

bristol.ac.uk

Policy implications

Facilitating procurement digitalisation requires:

- Accelerating the implementation of a single state-of-the-art data standard
- Establishing a robust multi-tiered information management system
- Investing in in-house digital capability and reducing dependency on outsourcing
- Establishing a robust process of technological scrutiny of new tech projects
- Clarifying the regulatory framework and generating meaningful minimum impact assessment requirements—which in my view need to be subjected to external approval

I was awarded a Mid-Career Fellowship by the British Academy for academic year 2022/23.

The fellowship 'support outstanding individual researchers and outstanding commissioners who will promote public engagement and understanding of the humanities and social sciences'. The award was a great honour and a big opportunity for me.

My project was entitled 'Digital technologies and public procurement: Governance and experimentation in digital public governance' and this is the high-level summary.

The pandemic accelerated the adoption of digital technologies by the public sector... Big data, blockchain, machine learning, and other forms of artificial intelligence increasingly underpin public governance and public services, such as digital procurement. Procurement regulates plays a dual role in the context of governance and experimentation. Firstly, procurement rules set the guidelines of the development and acquisition of digital technologies, control the interaction between public and private actors, and guide the deployment of digital technologies. Secondly, procurement practice is itself a living lab for experimentation with digital technologies to improve governance and prevent corruption, collusion, and the waste of taxpayers' funds. Aiming to improve public governance and public service delivery in the digital space, the project examines the dual role of procurement in relation to digital technology adoption.

The project involved writing up the iteratively refined monograph, as well as a series of blog posts based on working papers, policy texts, online workshops and a public lecture. This page provides links to all these materials.

Blog posts

- Public procurement governance as an information intensive exercise, and the ethics of digital technologies (HTC&N, 10 September 2022)
- Digital procurement governance: drawing a feasibility boundary (HTC&N, 29 September 2022)
- Emerging risks in digital procurement governance (HTC&N, 21 October 2022)
- Governing the assessment and taking of risks in digital procurement governance (HTC&N, 21 November 2022)
- Ensuring algorithmic transparency through public contracts? (The Digital Constitutionist, 24 November 2022)
- What are the main governance opportunities and challenges for procurement digitalisation? (University of Bristol Law School Research Blog, 5 December 2022)

SSRN Working papers

- 'The technological promise of digital governance: procurement as a case study of "jockey infeasibility"' (10 September 2022)
- 'Rebuilding the promise: A feasibility boundary for digital procurement governance' (19 September 2022)
- 'Identifying emerging risks in digital procurement governance' (21 October 2022)
- 'Governing the assessment and taking of risks in digital procurement governance' (21 November 2022)
