

1a. What problem are you solving?

I am solving the problem of GW Students having so many applications on their devices to be able to monitor their dining dollars, mobile id, laundry services, and more.

1b. What specific need did you consider when selecting this problem?

As a Freshman at GW, I quickly became aware of the many applications needed for everyday life on this campus. It can be hard to remember which applications accomplish what, and therefore I propose one main application with all the necessary information in one place.

2. What is your engineering solution?

I propose the development of one main application that has access to all the necessary information a student of GW needs (ie. vex schedules, linked to the laundry services, dining dollars information, mobile id, and a calendar of events all in one place).

3a. What are the created values?

My application will value simplicity and aim to help the students of GW save time.

3b. What is the impact of your solution?

My application will have a great impact on the students of GW (specifically the freshman class) because it will allow them to access all the pertinent information in one place. The transition to college can be hard, and my application will hopefully help our students have an easier time getting the information they need.
