BACKGROUND

The present study sought to address the gap in the literature, by examining the impact of HEXACO personality traits on application category use overall.

Smartphone Use

- 90% of Americans own a smartphone¹
- 46% of online respondents reported that they could not live without their phone²
- Higher usage has positively correlated with high neuroticism/emotionality and low conscientiousness. Lower usage has been moderately associated with honesty-humility, agreeableness, and openness³

Personality

- HEXACO Model⁴
- Honesty-humility was associated with higher self-control and lower self-posting behaviors⁵
- Emotionality was found to be positively correlated with social media application use as compared to in-person interaction⁶
- Extraversion was most often associated with communication app usage and social behaviors, making longer calls, sending more texts, and utilizing social media more^{7,8}
- Agreeableness has shown a negative correlation with smartphone use, predicting hardly any app usage⁹
- Higher conscientiousness has shown a positive relationship with work engagement and job performance¹⁰
- Openness to experience, associated with creative and imaginative qualities, was associated with video/audio/music apps⁹

METHOD

- First assessment of a longitudinal, four-part study
- Participants were excluded if they failed attention checks during Part 1 ($n = 47$)
- Out of 461 participants, a majority of the sample were undergraduate freshmen, Hispanic, and females with an average age of 19.

Demographic	<i>n</i>	%
Sex at Birth		
Female	337	73.1
Male	122	26.5
Missing	2	0.4
Race		
White	74	16.1
Hispanic	185	40.1
Asian	105	22.8
Black	67	14.5
Multiracial	28	6.1
Missing	2	0.4
Academic Year		
Freshman	331	71.8
Advanced	129	28.0
Missing	1	0.2
Socioeconomic Status		
Not Difficult	291	63.1
Difficult	154	33.4
Missing	16	3.5

Self-Reports Utilized:

- 24-Item Brief HEXACO Inventory¹¹
- Modified Version of the Facebook Intensity Scale¹²

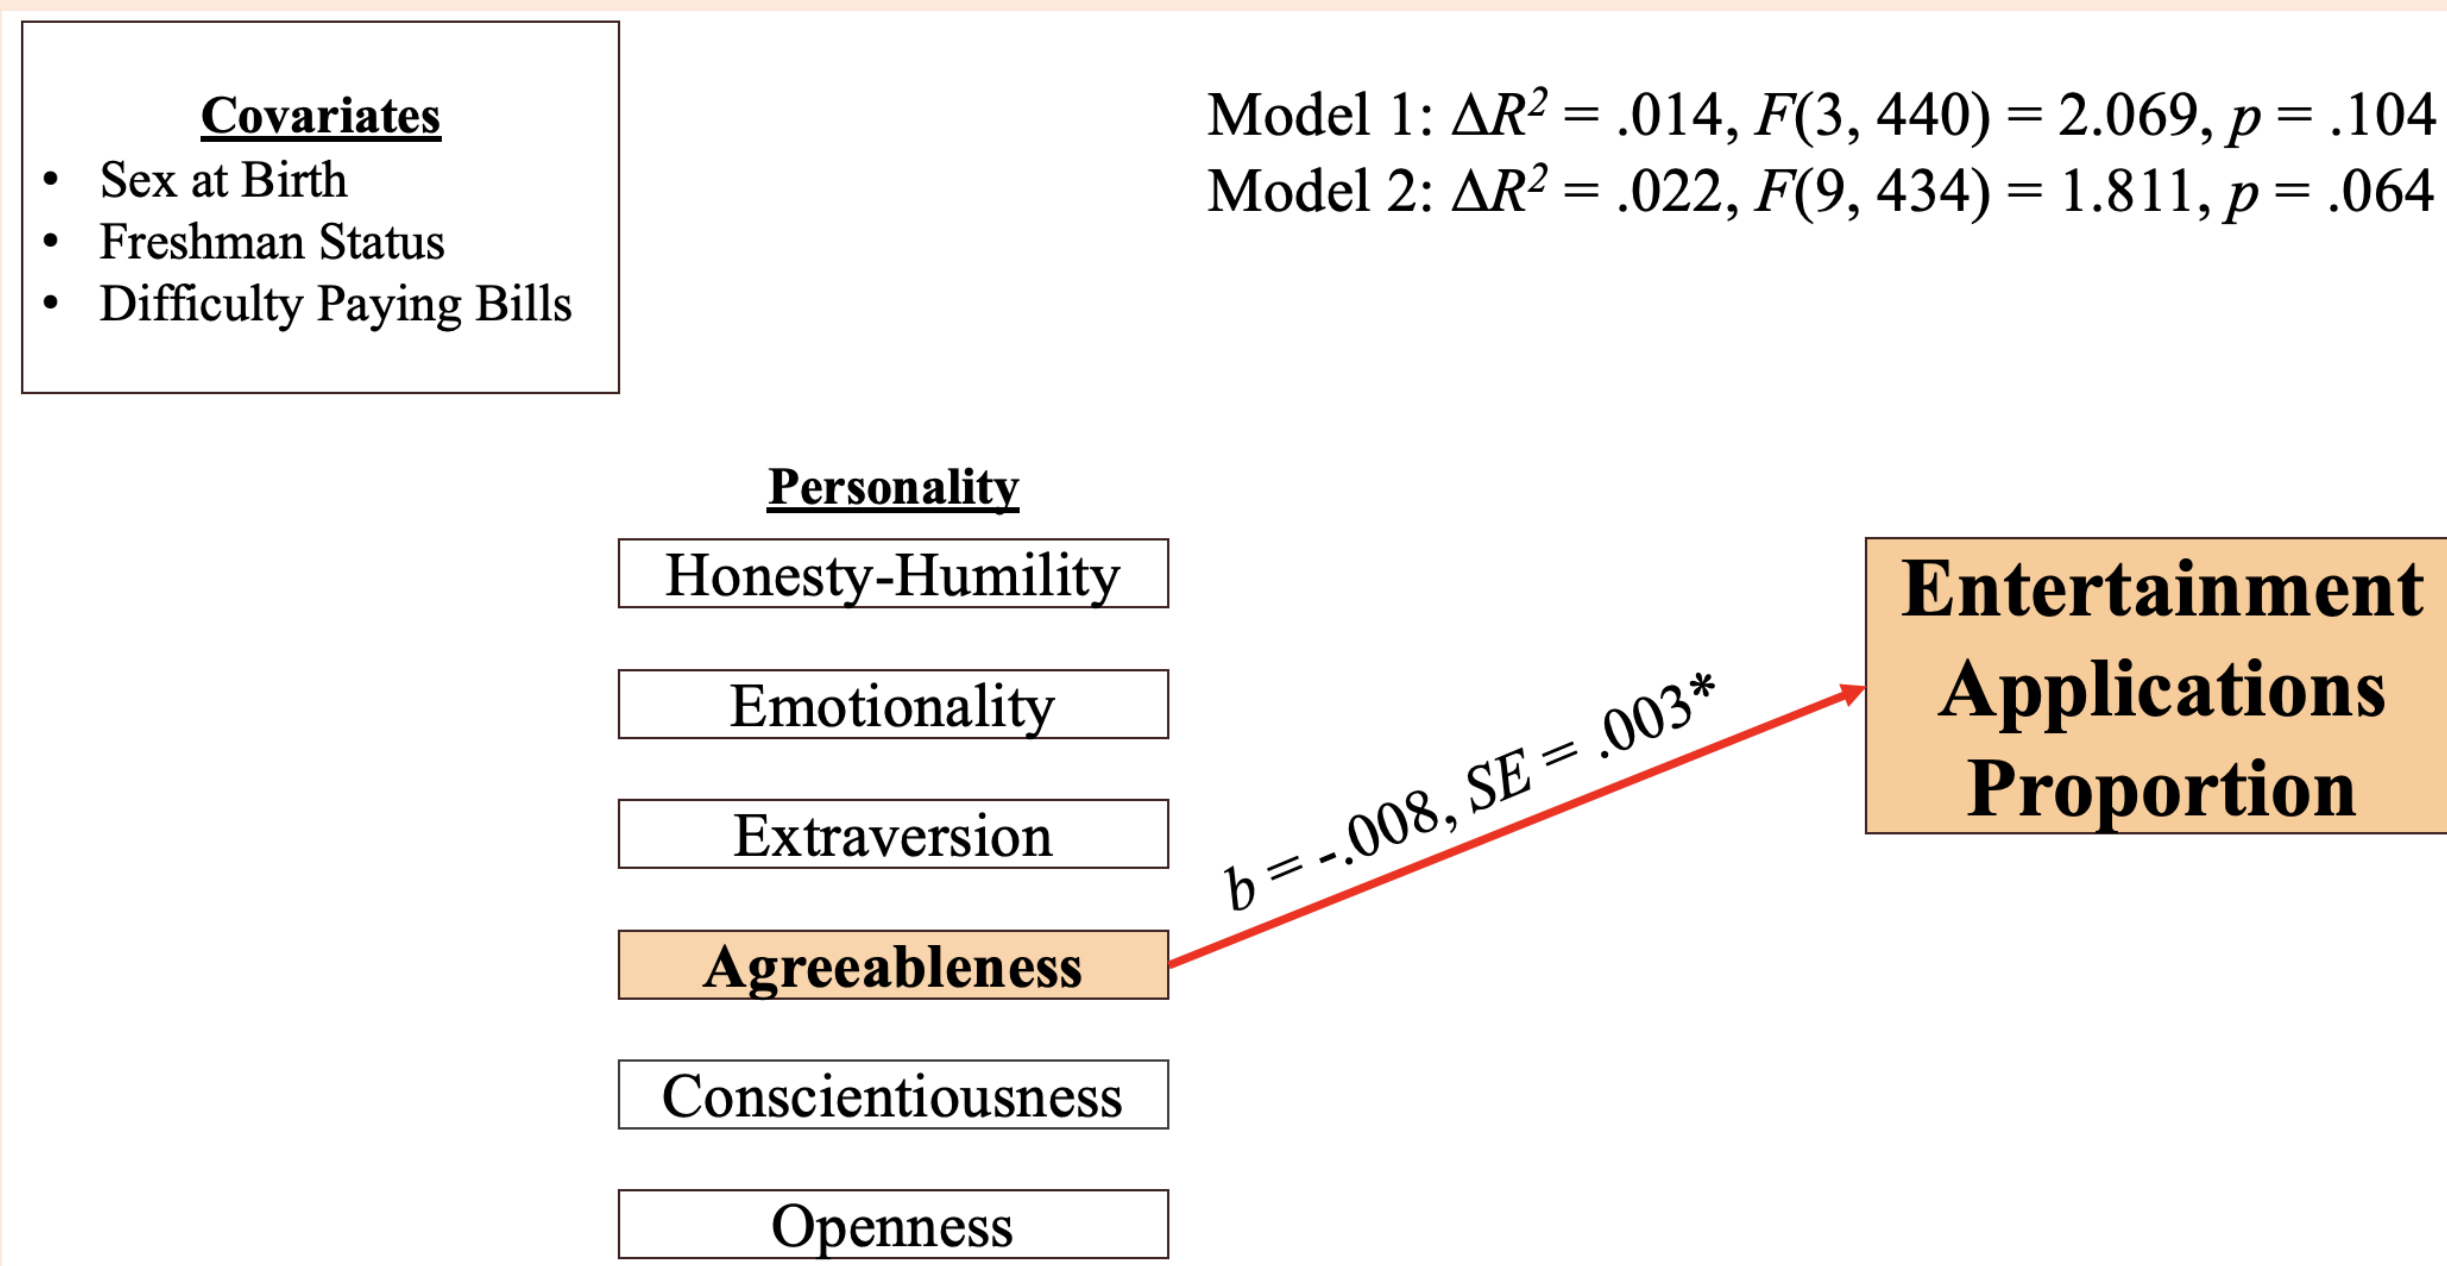

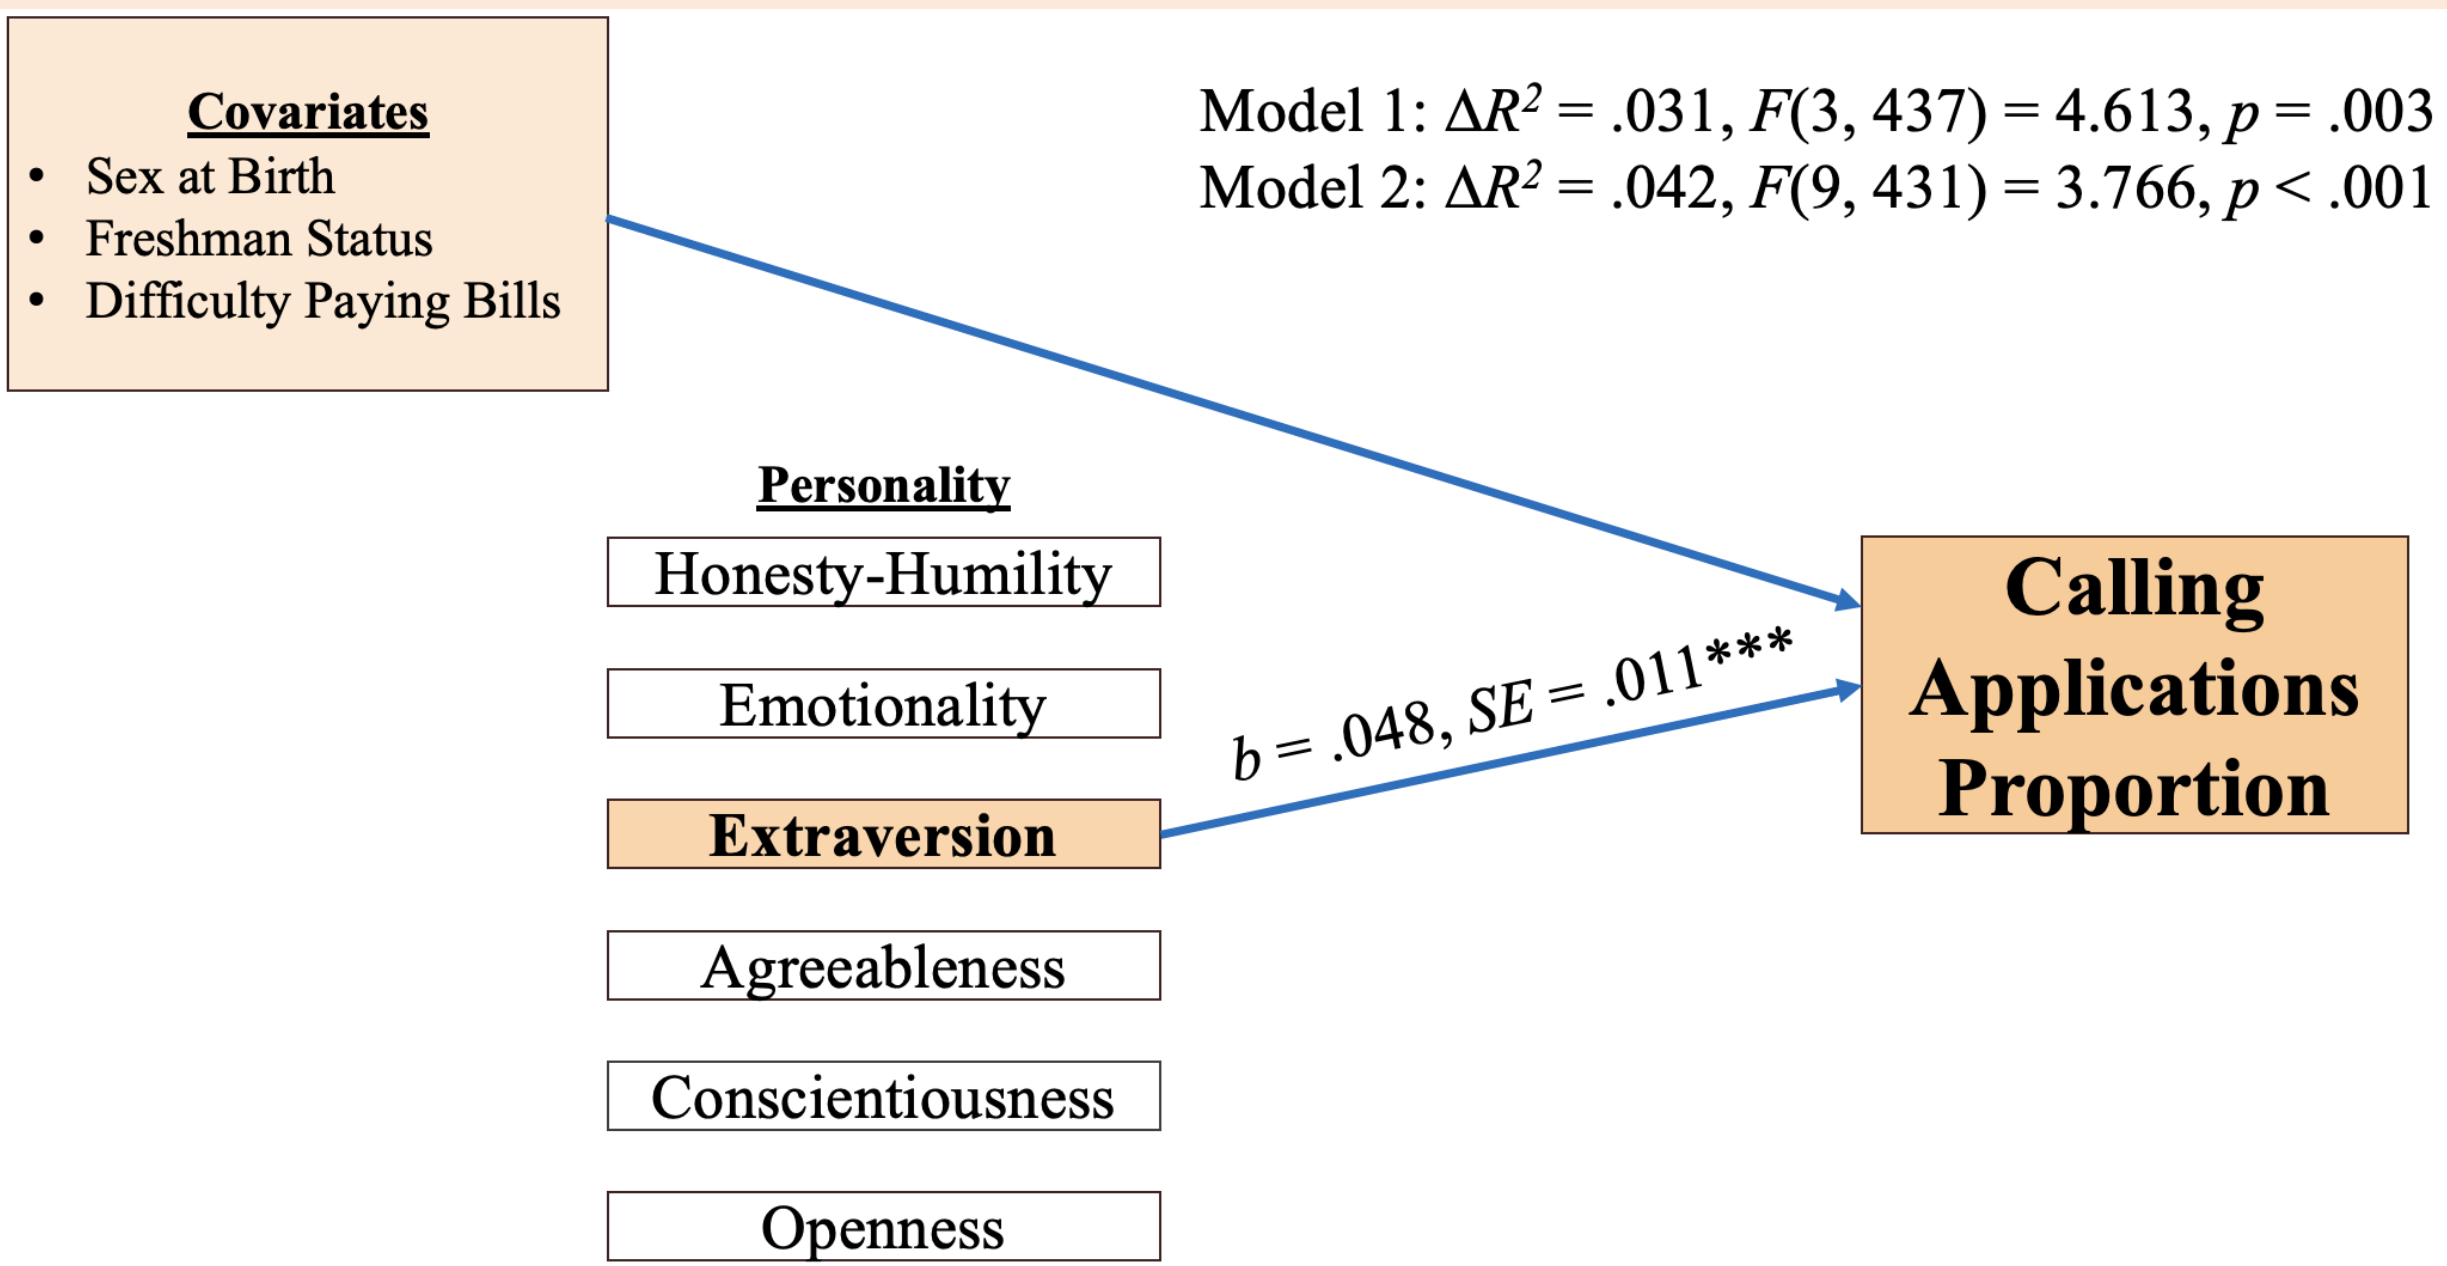

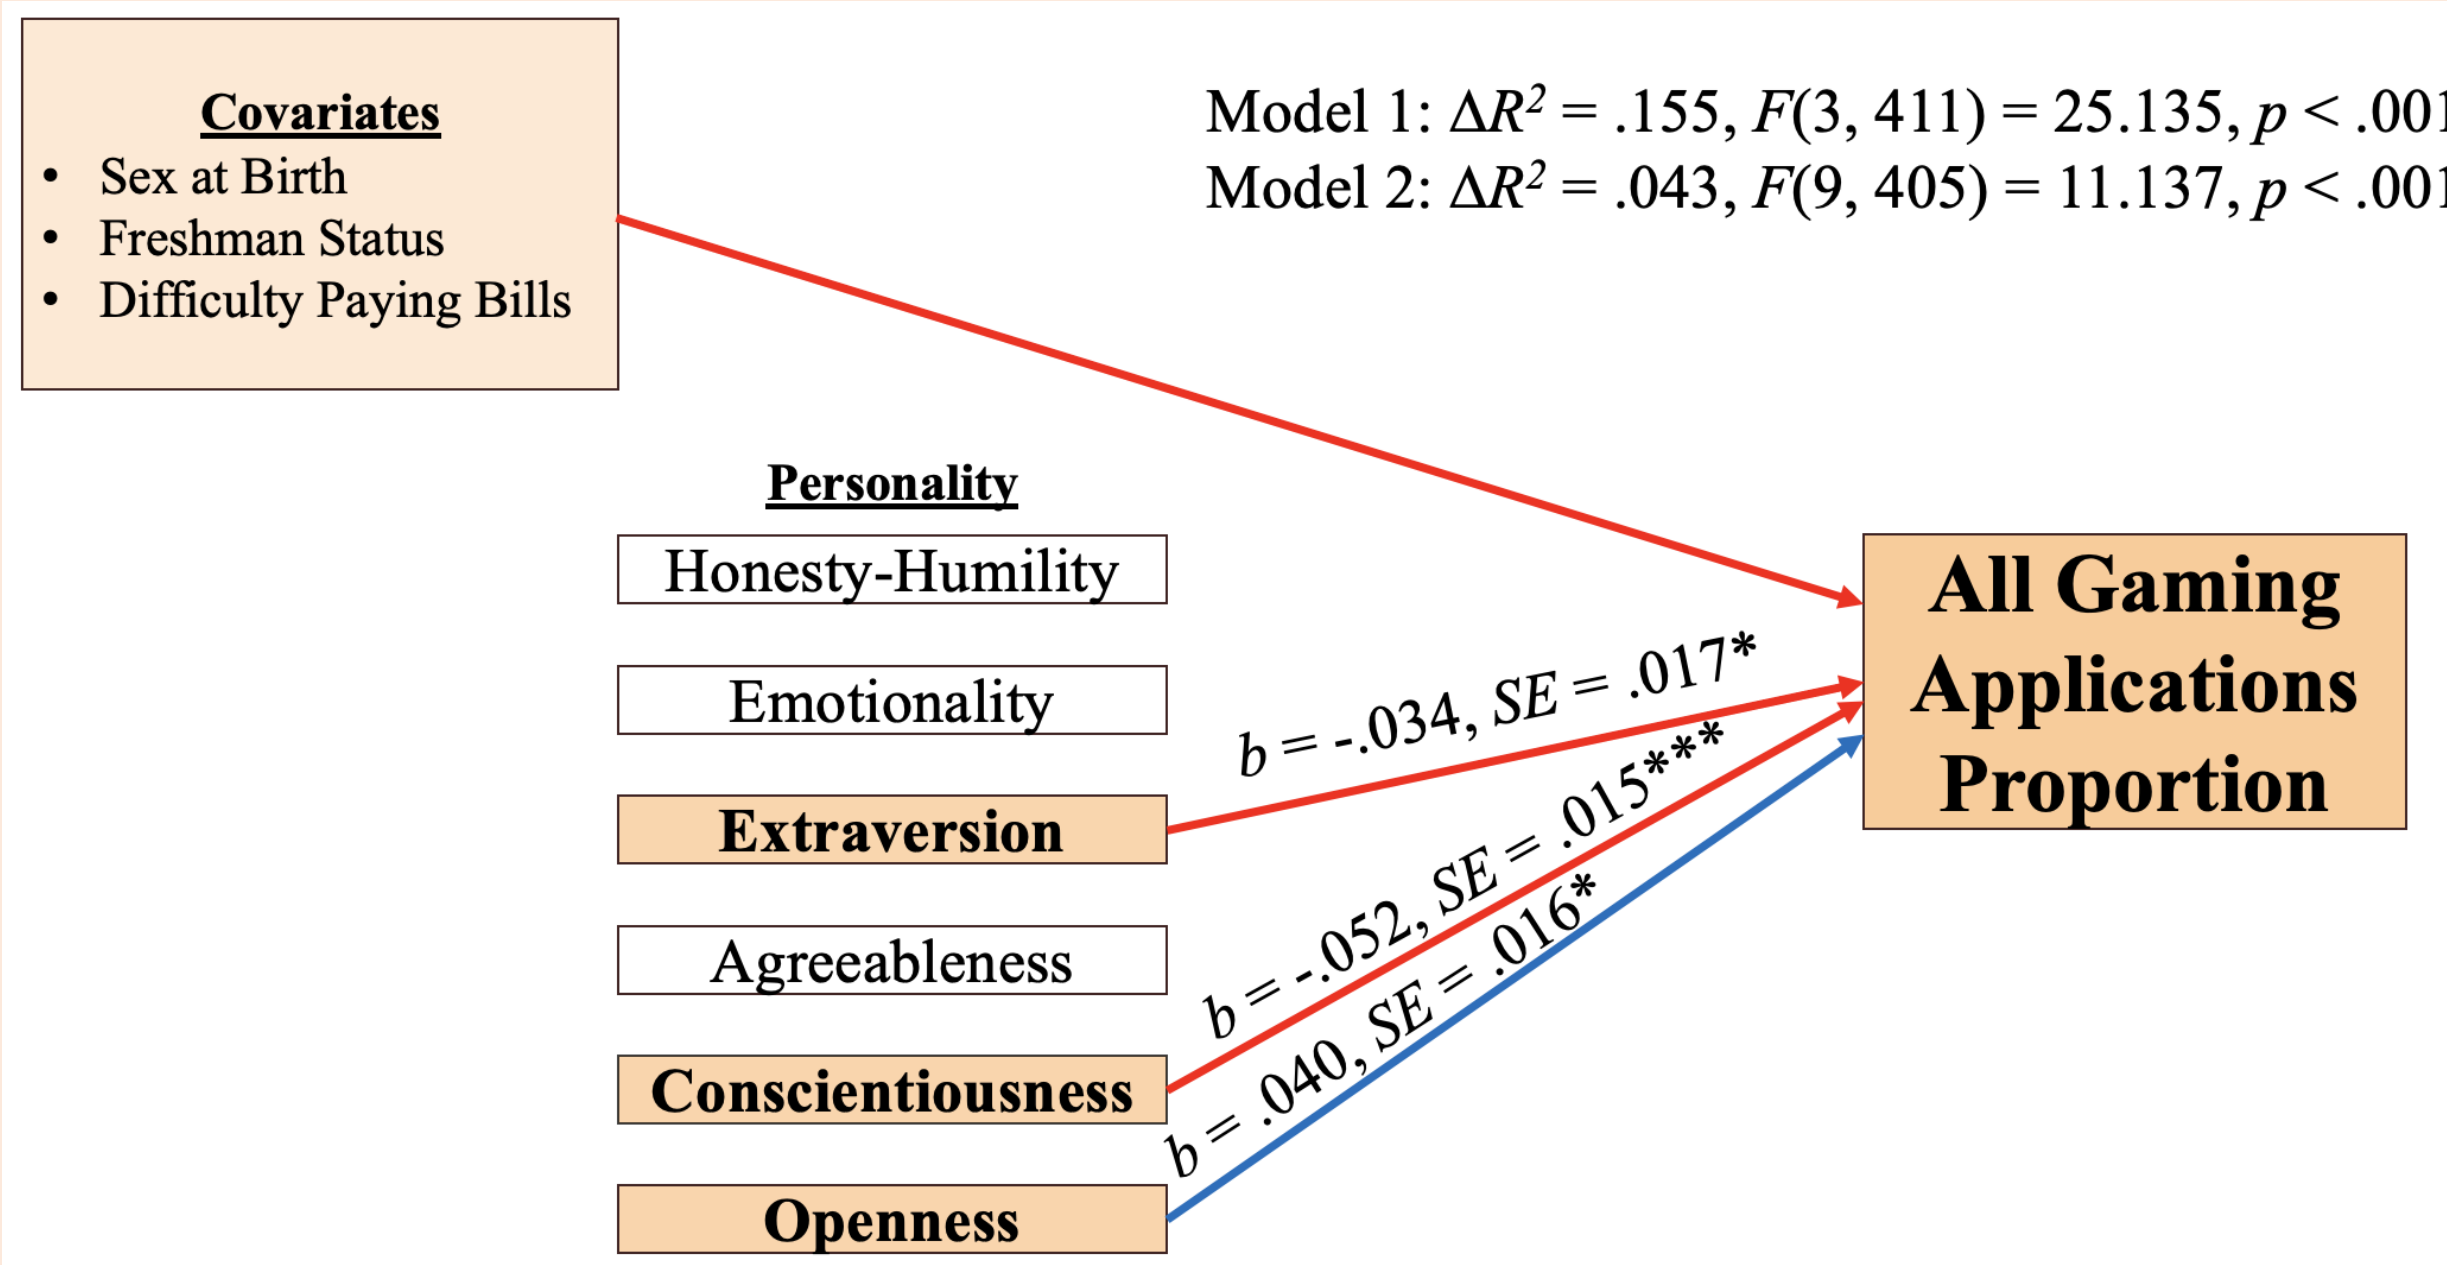

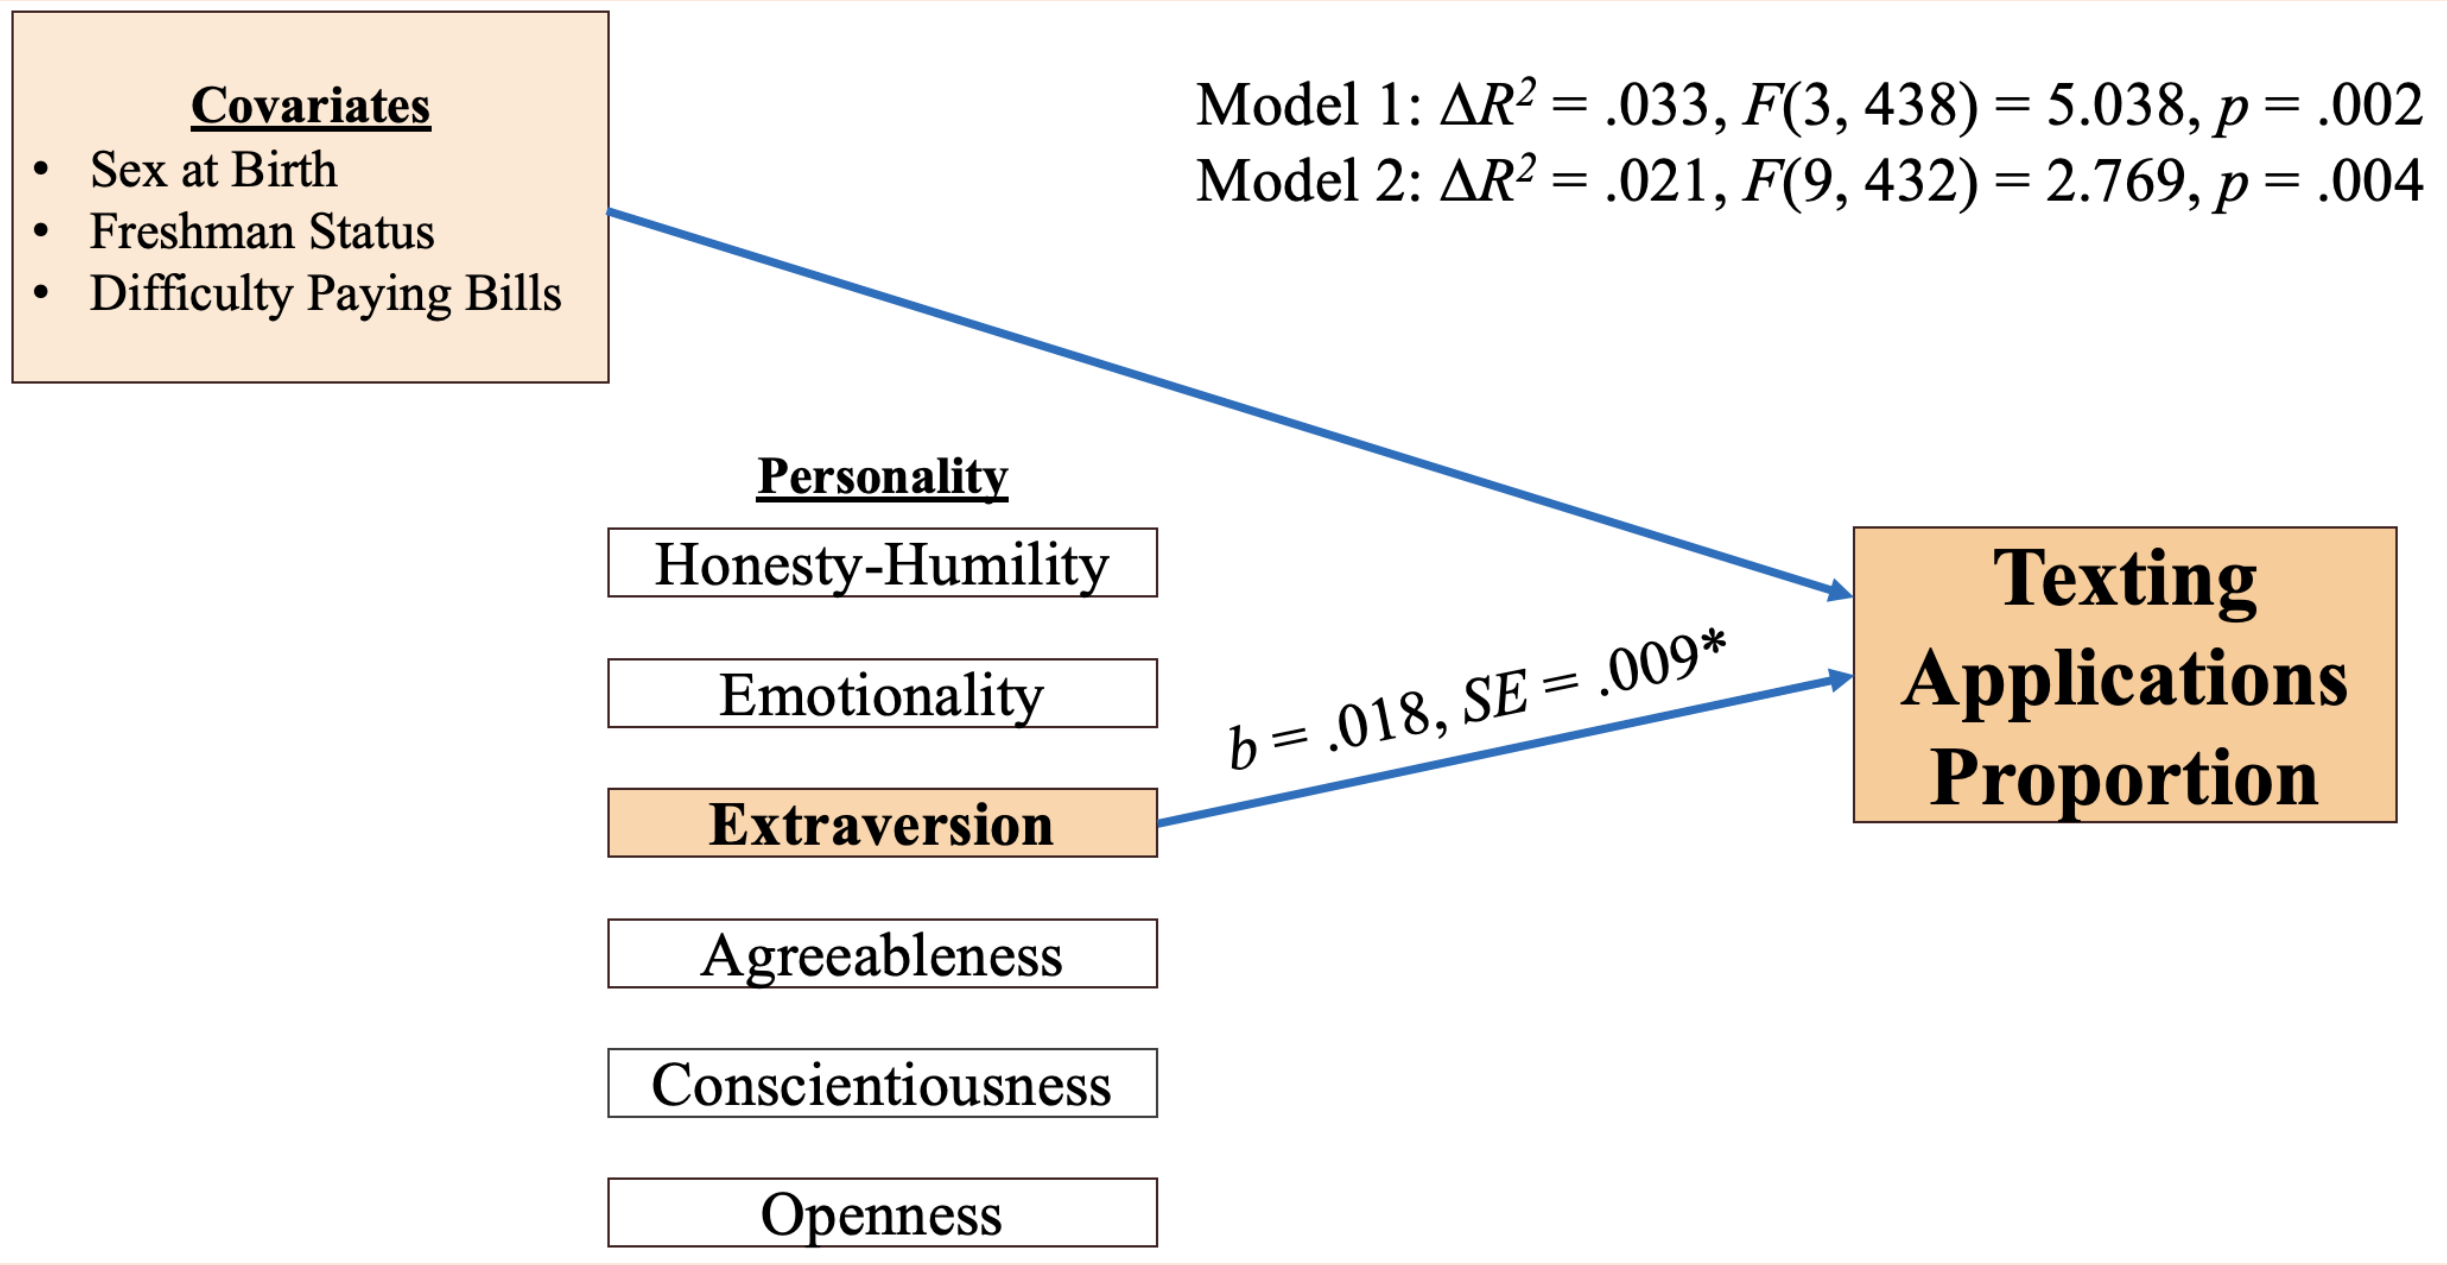

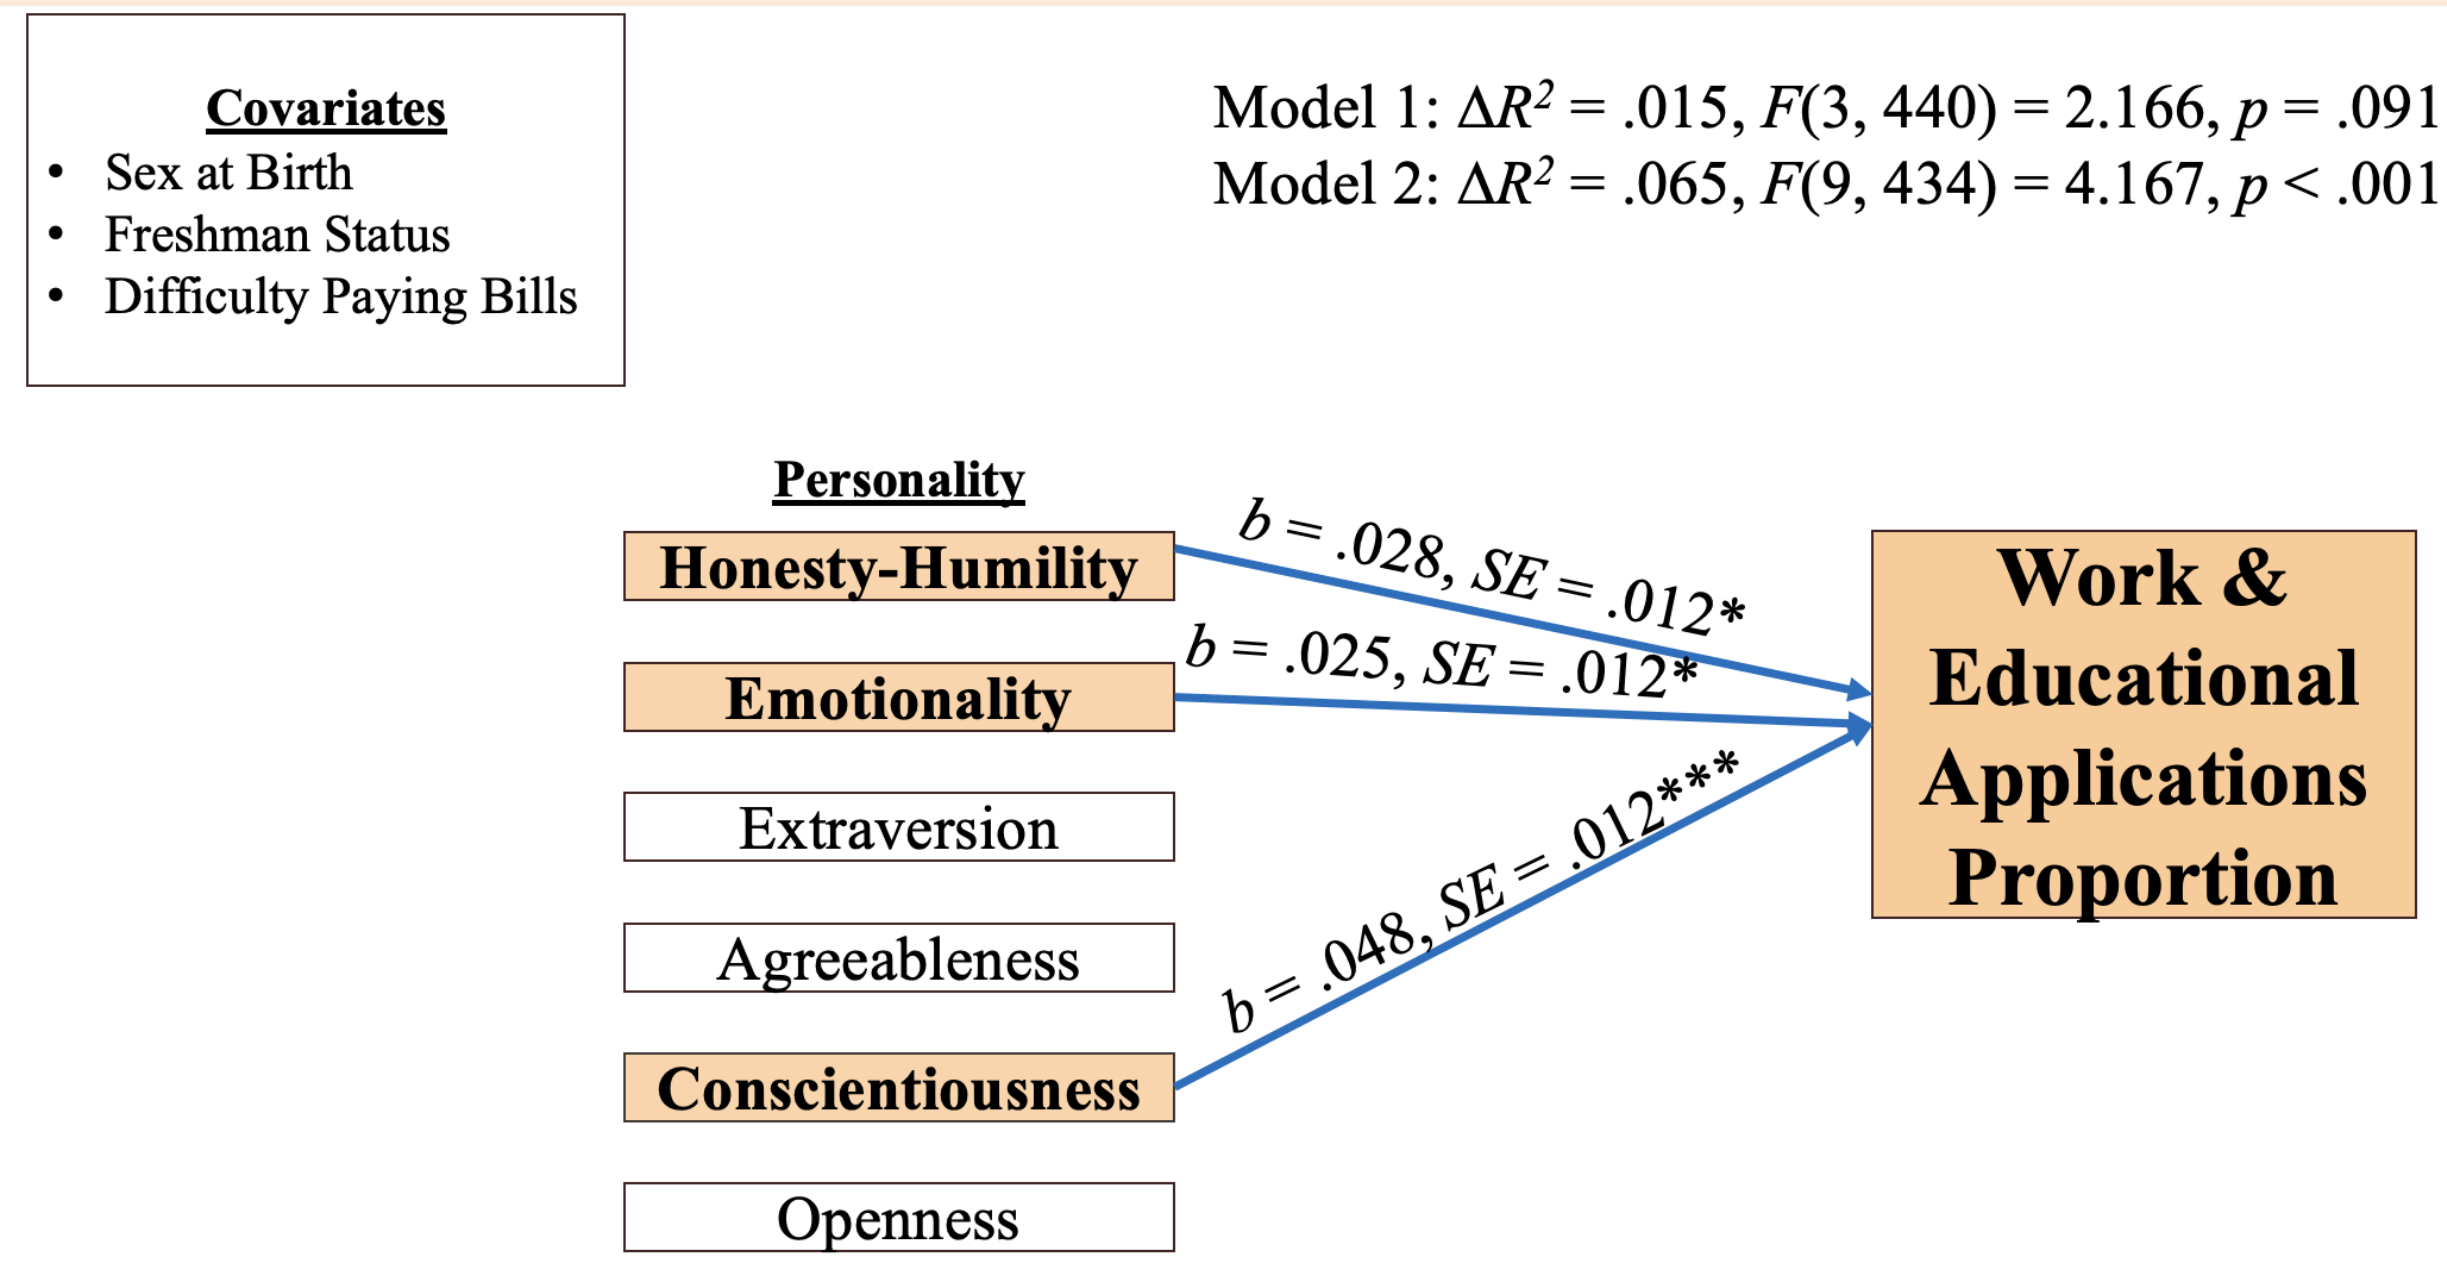

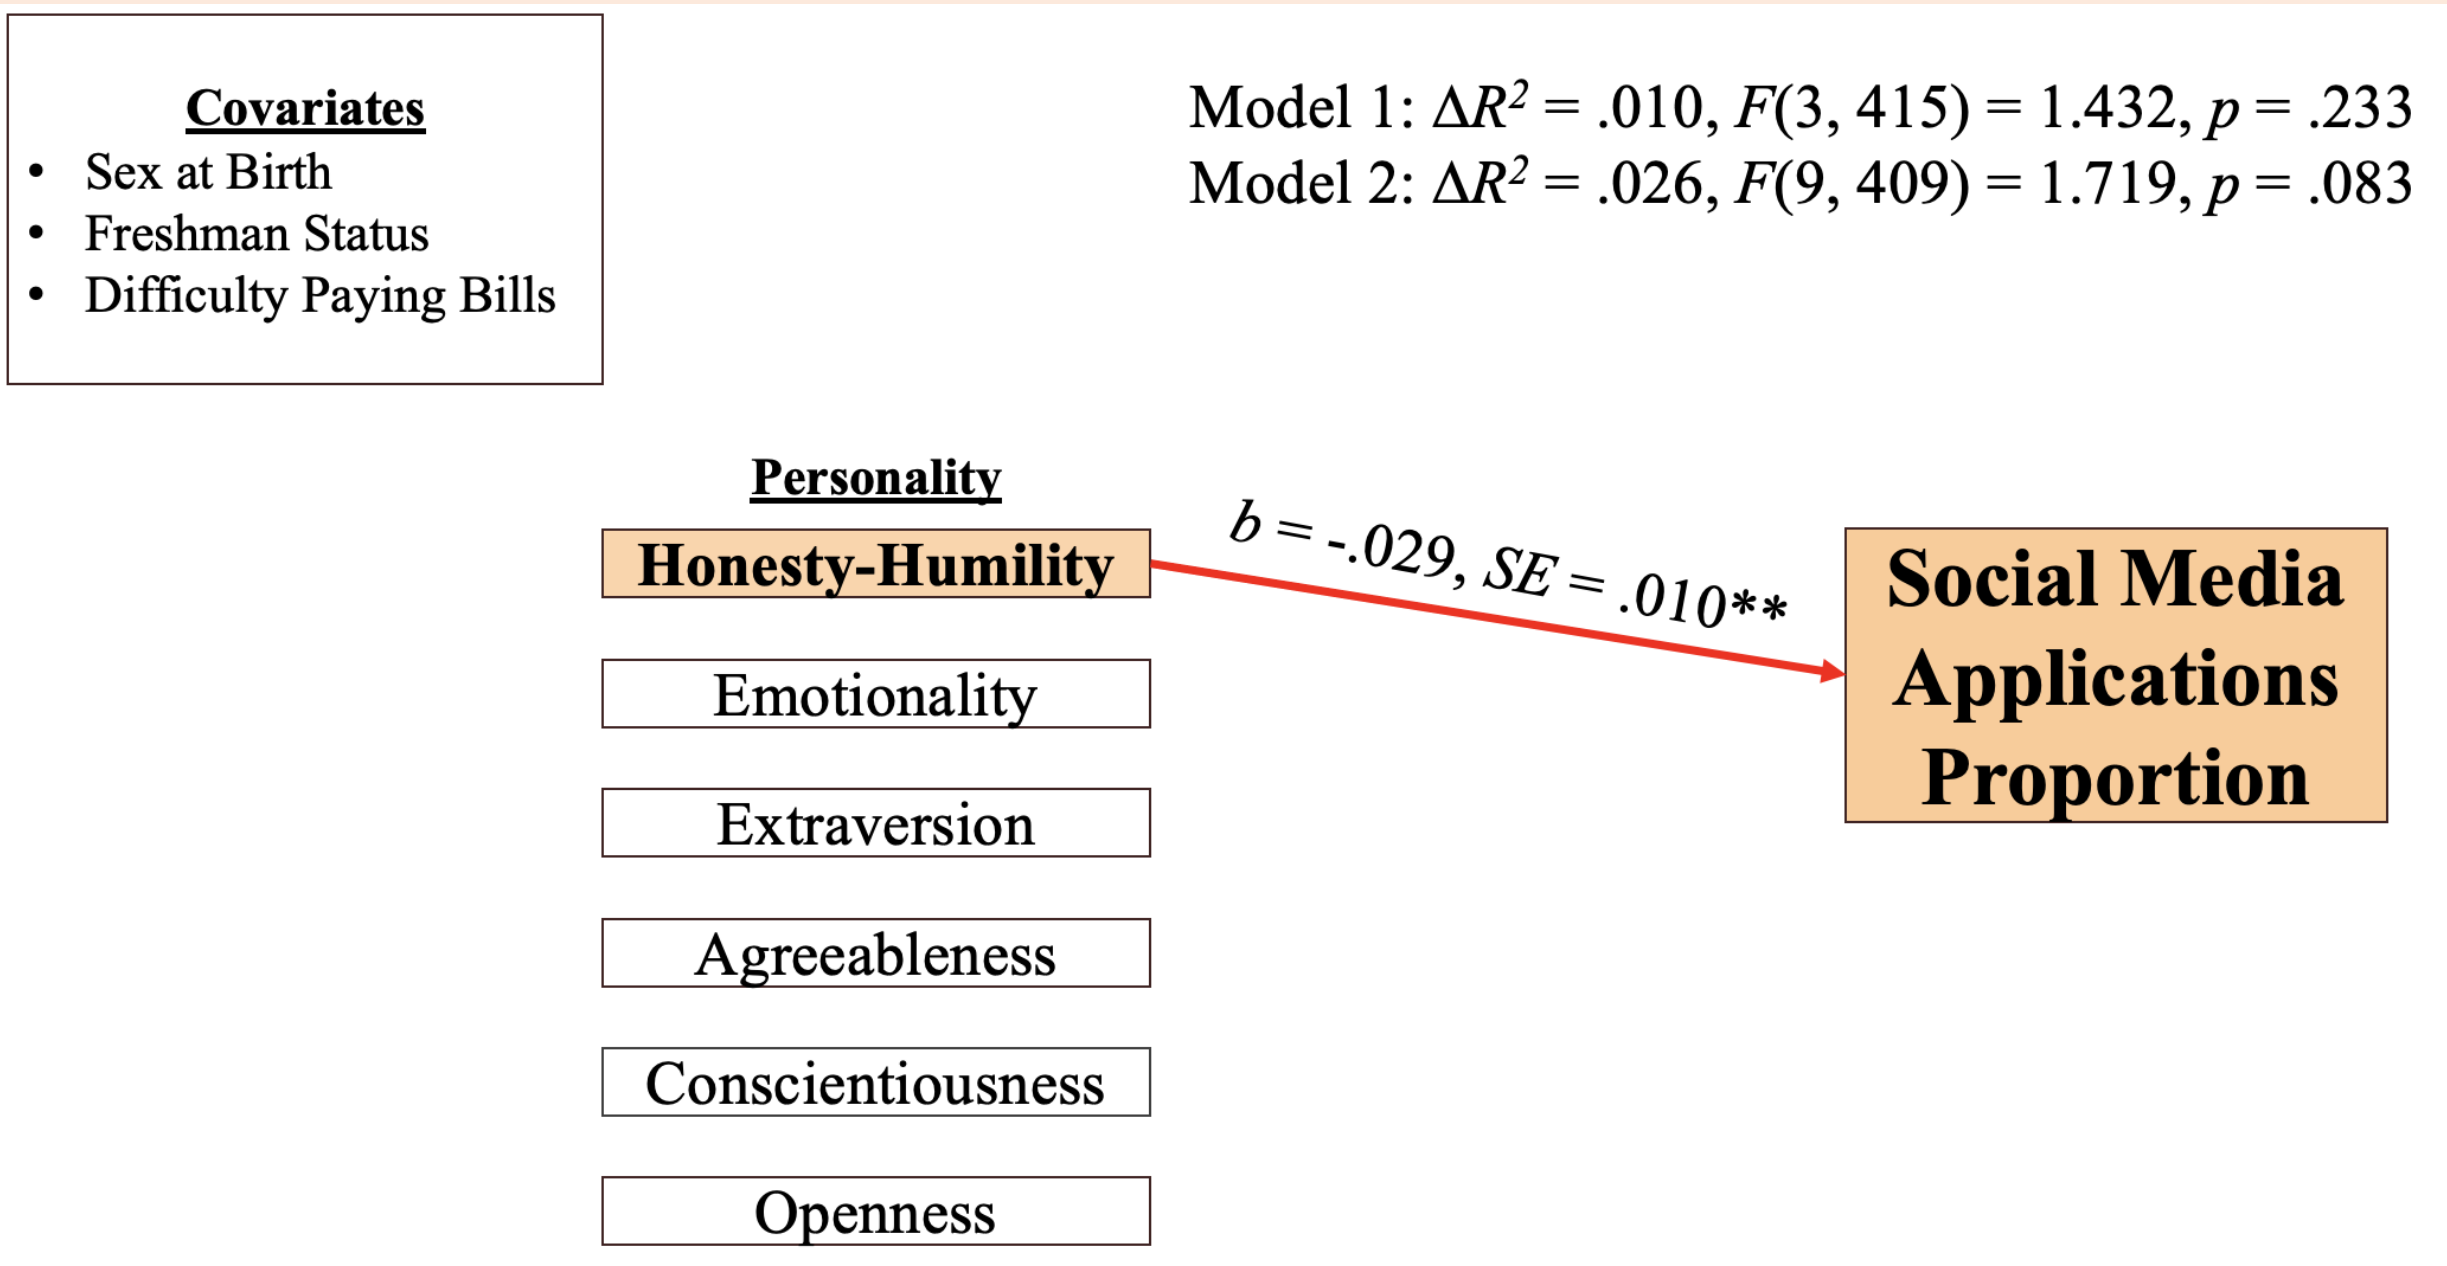

Analyses:

- Partial correlations: Hypothesis 1
- Hierarchical multiple regressions: Hypothesis 4
 - Model 1 included covariates and Model 2 was composed of all six HEXACO personality traits

Table 2. Partial Correlations of Personality and Smartphone Application Category Use

Figures 1-6. HEXACO Personality Traits Predict Smartphone Application Category Use

HYPOTHESES

- H1:** Personality traits would correlate with smartphone use.
 - Honesty-humility would be negatively correlated with total smartphone use.
- H2:** ↑ extraversion, emotionality, and openness to experience and ↓ honesty-humility would be related to ↑ social media usage.
- H3:** ↑ extraversion would predict ↑ social communication use (e.g., texting & calling)
- H4:** ↑ conscientiousness would predict increased work/educational application usage.
- H5:** ↓ extraversion and ↑ openness to experience would predict ↑ gaming usage.
- H6:** No hypothesized relationships between personality and entertainment application usage.

DISCUSSION

Findings underscore personality's role in shaping app engagement beyond demographics alone, suggesting potential for personality-targeted interventions to foster healthier digital habits.

- Honesty-humility, often associated with higher self-control¹³, was the only significant predictor of smartphone use.
- Higher honesty-humility predicted lower social media usage, suggesting a lower use of admiration seeking and self-presentation⁵, partially supporting hypothesis 2
- Consistent with previous research⁸, extraversion predicted higher levels of communication application use, supporting hypothesis 3
- Conscientiousness, related to goal-orientation and work motivation¹⁰, predicted increased work/educational application use, supporting hypothesis 4
- Higher extraversion and conscientiousness predicted the amount of gaming application use, supporting hypothesis 5 and previous research⁸
- Higher agreeableness was associated with decreased entertainment application use, potentially suggesting a higher ability to cope with negative emotions outside of app usage⁹
