

HW4: Shabani – QM1 Due Oct 28<sup>th</sup>

1. Show that  $E$  must exceed the minimum value of  $V(x)$  for every normalizable solution to the time-independent Schrodinger equation.
  
2. A particle in the infinite square well has the following stationary state using even mixture of ground state and first excited state marked by  $\psi_1$  and  $\psi_2$ :

$$\Psi(x, 0) = A[\psi_1(x) + \psi_2(x)]$$

- (a) Normalize the above wavefunction.
- (b) Find the time evolution at  $t = t_0$
- (c) Compute  $\langle x \rangle$ .
- (d) Compute  $\langle p \rangle$ .
