- Carr and Torricelli (2021) propose a class of distributions consistent with risk-neutral pricing for which the pricing of vanilla options is elementary
- We wish to investigate whether such elementary pricing can be extended to the pricing of compound options
- Compound options are used for:
 - the pricing of *options on levered equity* (Geske 1979b, Toft and Prucyk 1997)
 - the modelling of the *firm's equity* in structural models of default (Geske 1977, Hull et al. 2004, Geske et al. 2016)
 - the evaluation of *American claims* (Roll 1977, Geske 1979a, Whaley 1981, Prekopa and Szantai 2010)
 - the pricing of some *exotic derivatives* (Carr 1988, Buraschi and Dumas 2001, Barone 2013)

Dagum distribution

Research question

Related literature

An alternative distribution for asset prices

Dagum, skew-logistic and Singh-Maddala distributions

Married put

Compound married put

American call on asset with known discrete dividend

References

We say that a positive random variable X follows a Dagum distribution, i.e. $X \sim D(m, p, q)$, with $m > 0$, $p > 0$, $q > 0$ if its PDF and CDF are

$$f_X(x; m, p, q) = \frac{p}{q} \frac{\left[1 + \left(\frac{x}{m}\right)^{-p}\right]^{-\frac{1}{q}-1}}{x} \left(\frac{x}{m}\right)^{-p}$$

$$F_X(x; m, p, q) = \left[1 + \left(\frac{x}{m}\right)^{-p}\right]^{-\frac{1}{q}}$$

- m controls the location of X and $\mathbb{E}X = m$ if $p > 1$; if $0 < p < 1$ the mean does not exist as the integral diverges
- p controls the precision (that is p^{-1} controls the dispersion)
- q controls the skewness of $\ln X$: for $0 < q < 1$ odds moments are positive, for $q > 1$ odds moments are negative, for $q = 1$, $\ln X$ is symmetric

References

We will refer to *conjugate-power* Dagum (CPD), *conjugate-power* skew-logistic (CPSL) and *conjugate-power* Singh-Maddala (CPSM) random variables.

These variables are defined via $D(m, p, q)$, for which we further assume that

$$\frac{1}{p} + \frac{1}{q} = 1.$$

that is the dispersion and skew parameters of the Dagum distribution are *Hölder conjugate*. Letting

$$b := \frac{1}{p} \in (0, 1) \iff 1 - b = \frac{1}{q} \in (0, 1)$$

we have $X \sim \text{CDP}(m, b) \equiv D(m, 1/b, 1/(1 - b))$.

- as $p = 1/b > 1$, the mean of the conjugate-power Dagum is finite and equal to m
- given $q = 1/(1 - b) > 1$, the conjugate-power skew-logistic random variable is negatively skewed
- Carr and Torricelli (2021) show that the Dagum distribution exhibit mild excess kurtosis

We need to show that the distribution of S_T under \mathbb{Q} is actually risk-neutral. If $S_T \stackrel{\mathbb{Q}}{\sim} \text{CPD}(S_0, b(T))$, let $b(T) = b$ for convenience and

$$\begin{aligned} \mathbb{E}^{\mathbb{Q}}(S_T) &= \int_0^{\infty} u f_S^{\mathbb{Q}}(u) du \\ &= \int_0^{\infty} u \frac{1-b}{b} \frac{\left[1 + \left(\frac{u}{S_0}\right)^{-\frac{1}{b}}\right]^{b-2}}{u} \left(\frac{u}{S_0}\right)^{-\frac{1}{b}} du \\ &= \left(-S_0^{\frac{1}{b}} \left(u^{\frac{1}{b}} + S_0^{\frac{1}{b}}\right)^{b-1} \Big|_0^{\infty}\right) = 0 + S_0^{\frac{1}{b}} S_0^{\frac{b-1}{b}} = S_0 \end{aligned}$$

as $\lim_{u \uparrow \infty} \left(u^{\frac{1}{b}} + S_0^{\frac{1}{b}}\right)^{b-1} = \lim_{u \uparrow \infty} u^{\frac{b-1}{b}} = \lim_{u \uparrow \infty} 1/u^{\frac{1}{b}} = 0$, given $b \in (0, 1)$.

Hence, the conjugate-power Dagum CDF is risk-neutral.

Married put

$$MP_T(S, K, T) = \max\{S_T, K\} = S_T \mathbb{1}_{S_T \geq K} + K \mathbb{1}_{S_T < K},$$

An alternative distribution for asset prices

Using risk-neutral valuation, the price of this claim is

Married put

$$\begin{aligned} MP_0(S, K, T) &= \mathbb{E}^{\mathbb{Q}}(MP_T(S, K, T)) = \mathbb{E}^{\mathbb{Q}}(S_T \mathbb{1}_{S_T \geq K} + K \mathbb{1}_{S_T < K}) \\ &= \mathbb{E}^{\mathbb{Q}}(S_T \mathbb{1}_{S_T \geq K}) + K \mathbb{Q}(S_T < K) \end{aligned}$$

Compound married put

American call on asset with known discrete dividend

Letting the Radon-Nikodym derivative $\eta_T = \frac{d\hat{\mathbb{Q}}}{d\mathbb{Q}} = \frac{S_T}{S_0}$, with $\mathbb{Q} \sim \hat{\mathbb{Q}}$, the main pricing equation follows

References

$$\begin{aligned} MP_0(S, K, T) &= S_0 \mathbb{E}^{\mathbb{Q}}(\eta_T \mathbb{1}_{S_T \geq K}) + K \mathbb{Q}(S_T < K) \\ &= S_0 \hat{\mathbb{Q}}(S_T \geq K) + K \mathbb{Q}(S_T < K) \end{aligned} \tag{1}$$

Trivially,

$$\begin{aligned} c_0(S, K, T) &= MP_0(S, K, T) - K \\ p_0(S, K, T) &= MP_0(S, K, T) - S_0 \end{aligned}$$

Married put: Log-normal asset prices

Research question

Related literature

An alternative distribution for asset prices

Married put

Compound married put

American call on asset with known discrete dividend

References

It is well known that if $R_{[0, T]}^A = R_T^A := \ln S_T - \ln S_0$, is distributed as

$$R_T^A \stackrel{\mathbb{Q}}{\sim} \mathcal{N}(\mu^{\mathbb{Q}}(T), \sigma(T)^2)$$

then

$$R_T^A \stackrel{\widehat{\mathbb{Q}}}{\sim} \mathcal{N}(\mu^{\widehat{\mathbb{Q}}}(T), \sigma(T)^2) \equiv \mathcal{N}(\mu^{\mathbb{Q}}(T) + \sigma(T)^2, \sigma(T)^2)$$

that is the change of measure translate into *shifting* the mean of the distribution of log-returns. Hence

$$MP_0(S, K, T) = S_0 \Phi\left(\frac{\ln \frac{S_0}{K} + \frac{\sigma^2}{2} T}{\sigma \sqrt{T}}\right) + K \Phi\left(\frac{\ln \frac{K}{S_0} + \frac{\sigma^2}{2} T}{\sigma \sqrt{T}}\right) \quad (2)$$

with $\Phi(\cdot)$ the CDF of a standard Normal. Such formula is obviously **not elementary**.

Married put: Conjugate-power Dagum asset prices

Research question

To price the married put, $\mathbb{Q}(S_T < K)$ is nothing but the CDF of S_T under \mathbb{Q} .
To obtain the distribution of S_T under $\widehat{\mathbb{Q}}$ notice that

Related literature

An alternative distribution for asset prices

$$\begin{aligned}\widehat{\mathbb{Q}}(S_T < x) &= \Lambda(\mathbb{Q}(S_T < x)) = \frac{\int_0^x uf_S^{\mathbb{Q}}(u; S_0, b) du}{\int_0^\infty uf_S^{\mathbb{Q}}(u; S_0, b) du} \\ &= \frac{\int_0^x uf_S^{\mathbb{Q}}(u; S_0, b) du}{S_0}\end{aligned}$$

Married put

Compound married put

American call on asset with known discrete dividend

given that S_0 is the risk-neutral mean of S_T and $\Lambda : [0, 1] \rightarrow [0, 1]$ is the Lorenz curve applied to the risk-neutral CDF $F_S^{\mathbb{Q}}$.

References

In financial terms, the Lorenz curve relates the share measure distribution function $F_S^{\widehat{\mathbb{Q}}}$ to the risk-neutral measure distribution function $F_S^{\mathbb{Q}}$. Essentially, calculating the Lorenz curve of the risk-neutral CDF allows to calculate probabilities under the measure that has S as a numéraire.

Therefore,

$$MP_0 \left(S, \begin{pmatrix} K_1 \\ K_2 \end{pmatrix}, \begin{pmatrix} T_1 \\ T_2 \end{pmatrix} \right) = \mathbb{E}^{\mathbb{Q}} \left(MP_{T_1}(S, K_2, T_2) \mathbb{1}_{S_{T_1} \geq K^*} \right) + K_1 \mathbb{Q}(S_{T_1} < K^*). \quad (4)$$

The value K_* is model-dependent and in the case of log-normal asset prices must be computed numerically. We show that in the conjugate-power Dagum setting is elementary instead.

In the following we must assume $T := T_1 = T_2/2$, which we refer as *symmetric compound married put*.

The reason for such restriction is that the bewilderment function is not a pre-specified function, but only require to vanish as the time-to-maturity vanishes and to be bounded in $(0, 1)$. As it depends on the size of time intervals $[0, T_1]$ and $[T_1, T_2]$ only, the only way to work with *identical* bewilderment functions is to assume symmetry in the time steps.

Let $R_{[0,T]}^G = \frac{S_T}{S_0} | S_0$ and $R_{[T,2T]}^G = \frac{S_{2T}}{S_T} | S_T$ and assume a multiplicative random walk with iid factors such that

$$R_{[0,T]}^G \stackrel{Q}{\sim} R_{[T,2T]}^G \stackrel{Q}{\sim} \text{CPD}(1, b(T)).$$

Unlike what happens in the case of log-normal asset prices, there is no such reproductive property for either sums or products of Dagum distributions, i.e.

$$R_{[0,2T]}^G = R_{[0,T]}^G \times R_{[T,2T]}^G \stackrel{Q}{\not\sim} \text{CPD}(1, b(2T)).$$

Hence

$$MP_0(S, K, 2T) \neq \left(S_0^{\frac{1}{b(2T)}} + K^{\frac{1}{b(2T)}} \right)^{b(2T)}$$

but

$$MP_T(S, K, 2T) = \left(S_T^{\frac{1}{b(T)}} + K^{\frac{1}{b(T)}} \right)^{b(T)}$$

Nonetheless, the **two-period married put** price can still be computed analytically.

Let $b(T) = b$. The critical K_* is defined via

$$\left(K_*^{\frac{1}{b}} + K_2^{\frac{1}{b}}\right)^b = K_1,$$

and elementary

$$K_* = \left(K_1^{\frac{1}{b}} - K_2^{\frac{1}{b}}\right)^b$$

The first expectation in (4) can be expressed as

$$\begin{aligned} \mathbb{E}^{\mathbb{Q}}(MP_T(S, K_2, 2T)\mathbb{1}_{S_T \geq K_*}) &= \int_{K_*}^{\infty} MP_T(u, K_2, 2T) f_S^{\mathbb{Q}}(u) du \\ &= \int_{K_*}^{\infty} u \left[1 + \left(\frac{u}{K_2}\right)^{-\frac{1}{b}}\right]^b \frac{1-b}{b} \frac{\left[1 + \left(\frac{u}{S_0}\right)^{-\frac{1}{b}}\right]^{b-2}}{u \left(\frac{u}{S_0}\right)^{\frac{1}{b}}} du \\ &= \int_{K_*}^{\infty} \frac{1-b}{b} \left(\frac{u}{S_0}\right)^{-\frac{1}{b}} \left[1 + \left(\frac{u}{S_0}\right)^{-\frac{1}{b}}\right]^{b-2} \left[1 + \left(\frac{u}{K_2}\right)^{-\frac{1}{b}}\right]^b du. \end{aligned} \quad (6)$$

Technical result

Theorem

Given random variable $X \sim \text{CPD}(\mu, b)$ with PDF f , it follows

$$\begin{aligned} I(\mu, m, b, a) &= \int_a^\infty x \left[1 + \left(\frac{x}{m} \right)^{-\frac{1}{b}} \right]^b f(x; \mu, b) dx \\ &= a \left(\frac{\mu}{a} \right)^{\frac{1}{b}} F_1 \left(1 - b; 2 - b, -b; 2 - b; - \left(\frac{\mu}{a} \right)^{\frac{1}{b}}, - \left(\frac{m}{a} \right)^{\frac{1}{b}} \right), \end{aligned}$$

with $m > 0$ and $F_1(a; b_1, b_2; c; x, y)$ the Appell hypergeometric function of the first kind. Moreover, if $\mu = m$

$$\begin{aligned} I(\mu, b, a) &= \int_a^\infty x \left[1 + \left(\frac{x}{\mu} \right)^{-\frac{1}{b}} \right]^b f(x; \mu, b) dx \\ &= a \left(\frac{\mu}{a} \right)^{\frac{1}{b}} {}_2F_1 \left(1 - b; 2 - 2b; 2 - b; - \left(\frac{\mu}{a} \right)^{\frac{1}{b}} \right), \end{aligned}$$

where ${}_2F_1(\alpha, \beta; \gamma; x)$ is the hypergeometric function. Finally, if $\mu = m$ and $b = 1/2$

$$I(\mu, a) = \int_a^\infty x \left[1 + \left(\frac{x}{\mu} \right)^{-2} \right]^{\frac{1}{2}} f(x; \mu, 1/2) dx = \mu \tan^{-1} \left(\frac{\mu}{a} \right).$$

If furthermore, $b = 1/2$, its price is elementary and equal to

References

$$MP_0 \left(S, \left(\begin{matrix} K_1 \\ S_0 \end{matrix} \right), \left(\begin{matrix} T \\ 2T \end{matrix} \right) \right) \Big|_{b=1/2} = S_0 \tan^{-1} \left(\frac{S_0}{\sqrt{K_1^2 - S_0^2}} \right) + \sqrt{K_1^2 - S_0^2}$$

There is no such a parametrization for the Black-Scholes model such that the price of the compound married put (or option) is elementary.

Compound married puts and compound options

Compound married puts can be linked to compound call-on-calls and put-on-calls.

Compound married put

American call on asset with known discrete dividend

References

Letting $0 < D < K_2$ representing the discrete dividend, Whaley's decomposition of the American option price is

$$C_0(S, K_2, T_2) = \underbrace{c_0(S, K_*, T_1)}_{(a)} + \underbrace{c_0(S, K_2, T_2)}_{(b)} - \underbrace{c_0(c(S, K_* + D - K_2, T_1), K_2, T_2)}_{(c)} \quad (8)$$

- (a) long a European call option with exercise price K_* (to be determined) and maturity T_1 ;
- (b) long a European call option with exercise price K_2 and maturity T_2 ;
- (c) short a compound call-on-call whose mother option is a European option with exercise price K_2 and maturity T_2 which is written on a European option with exercise price $K_* + D - K_2$ and maturity T_1 .

Roll (1977) shows that the value K_* is defined implicitly via

$$c_{T_1}(K_*, K_2, T_2) = K_* + D - K_2,$$

American call with known dividend: Conjugate-power Dagum asset prices

Research question

Let $T = T_1 = T_2/2$ (i.e. the dividend is paid *half-way* through the option maturity) and $b = b(T)$.

Related literature

An alternative distribution for asset prices

Married put

Compound married put

American call on asset with known discrete dividend

References

The value of K_* is found solving

$$\left(K_*^{\frac{1}{b}} + K_2^{\frac{1}{b}} \right)^b - K_2 = K_* + D - K_2$$

that is

$$(K_* + D)^{\frac{1}{b}} - K_*^{\frac{1}{b}} = K_2^{\frac{1}{b}}.$$

Letting $p = 1/b \in \mathbb{N} \setminus \{1\}$ and factoring the difference of powers

$$D \sum_{j=0}^{p-1} (K_* + D)^{p-j-1} K_*^j = K_2^p$$

If $b \in \{1/2, 1/3, 1/4, 1/5\}$ (or, equivalently, $p \in \{2, 3, 4, 5\}$), the Abel-Ruffini theorem ensures the existence of K_* elementary obtainable as a function of polynomials. For example,

$$K_* = \frac{K_2^2}{2D} - \frac{D}{2}, \text{ for } b = 1/2 \qquad K_* = \sqrt{\frac{4K_2^3 - D^3}{3D}} - \frac{D}{2}, \text{ for } b = 1/3$$

American call with known dividend: Conjugate-power Dagum asset prices

Research question

Rewrite (8) in terms of married put prices, that is

$$C_0(S, K_2, 2T) = MP_0(S, K_*, T) - K_* + MP_0(S, K_2, 2T) - K_2 \\ - MP_0\left(S, \left(\frac{K_* + D}{K_* + D - K_2}\right), \left(\frac{T}{2T}\right)\right) + (K_* + D)$$

If $K_2 = S_0$ (American option is at-the-money) and $b = 1/2$ (K_* is elementary as well as the function for pricing the **two-period married put**), then the price becomes

$$C_0(S, S_0, 2T)\Big|_{b=1/2} = \sqrt{\left(\frac{S_0^2 - D^2}{2D}\right)^2 + S_0^2} + \frac{\pi}{2}S_0 - S_0 + D \\ - MP_0\left(S, \left(\frac{\frac{S_0^2 + D^2}{2D}}{\frac{S_0^2 + D^2}{2D} - S_0}\right), \left(\frac{T}{2T}\right)\right)\Big|_{b=1/2}.$$

To have an elementary compound married price, we need to further impose

$$\frac{S_0^2 + D^2}{2D} - S_0 = S_0 \iff D^2 - 4S_0D + S_0^2 = 0. \quad (9)$$

The solution of (9) such that early exercise is possible (i.e. $D \leq K_2 = S_0$) is $D_* = (2 - \sqrt{3})S_0 \approx 0.27S_0$.

American call with known dividend: Conjugate-power Dagum asset prices

Hence,

$$\begin{aligned}
 C_0(S, S_0, 2T) \Big|_{b=1/2}^{D=D_\star} &= \sqrt{\left(\frac{S_0^2 - D_\star^2}{2D_\star}\right)^2 + S_0^2} + \frac{\pi}{2} S_0 - S_0 + D_\star \\
 &\quad - S_0 \tan^{-1} \left(S_0 / \sqrt{\left(\frac{S_0^2 + D_\star^2}{2D_\star}\right)^2 - S_0^2} \right) \\
 &\quad - \sqrt{\left(\frac{S_0^2 + D_\star^2}{2D_\star}\right)^2 - S_0^2} \\
 &= \sqrt{\left(\frac{S_0^2 - D_\star^2}{2D_\star}\right)^2 + S_0^2} - \sqrt{\left(\frac{S_0^2 + D_\star^2}{2D_\star}\right)^2 - S_0^2} \\
 &\quad + S_0 \left(\cot^{-1} \left(S_0 / \sqrt{\left(\frac{S_0^2 + D_\star^2}{2D_\star}\right)^2 - S_0^2} \right) - 1 \right) + D_\star
 \end{aligned}$$

in which we use $\cot^{-1}(x) = \pi/2 - \tan^{-1}(x)$.

- We show how to price symmetric compound married puts, call-on-calls and put-on-calls when price ratios are iid conjugate-power Dagum random variables.
- Such distribution is consistent with risk-neutral pricing and allows for negative skewness and mild excess kurtosis.
- We show that, if the compound married put is issued at-the-money and $b = 1/2$, its price is elementary; there is no such parametrization under log-normality (or other known distribution) for which such a result is obtained.
- We show how to price an American call written on an asset that pays a known discrete dividend under the conjugate-power Dagum distribution, thus providing an alternative to the well-known Roll-Geske-Whaley formula.
- We show that the pricing of such American option also reduces to an elementary function under a given parameter combination.

$$\begin{aligned} F_Z^{\widehat{Q}}(z) &= \int_0^\infty F_Y^{\widehat{Q}}\left(\frac{z}{x}\right) f_X^{\widehat{Q}}(x) dx \\ &= \int_0^\infty \left\{ 1 - \left[1 + \left(\frac{z}{x}\right)^{\frac{1}{b}} \right]^{b-1} \right\} \frac{1-b}{b} \left(1 + x^{\frac{1}{b}}\right)^{b-2} x^{\frac{1}{b}-1} dx \\ &= \frac{1-b}{b} \left(\int_0^\infty \left(1 + x^{\frac{1}{b}}\right)^{b-2} x^{\frac{1}{b}-1} dx \right. \\ &\quad \left. - \int_0^\infty \left[1 + \left(\frac{z}{x}\right)^{\frac{1}{b}} \right]^{b-1} \left(1 + x^{\frac{1}{b}}\right)^{b-2} x^{\frac{1}{b}-1} dx \right) \end{aligned}$$

and that the survival function is equal to

$$\begin{aligned} \overline{F}_Z^{\widehat{Q}}(z) &= F_1\left(1-b, 1-b, 2-b, 2-b; -z^{\frac{1}{b}}, -1\right) \\ &\quad + \frac{1-b}{2-b} z^{-\frac{1-b}{b}} F_1\left(2-b, 1-b, 2-b, 3-b; -z^{-\frac{1}{b}}, -1\right) \end{aligned} \quad (11)$$

Two-period married put under conjugate-power Dagum asset prices

Research question

Related literature

An alternative distribution for asset prices

Married put

Compound married put

American call on asset with known discrete dividend

References

Given the results in (10) and (11), it is possible to price a two-period married put as

$$\begin{aligned}
 MP_0(S, K, 2T) &= S_0 \widehat{Q}(S_{2T} \geq K) + K Q(S_{2T} < K) = S_0 \widehat{F}_Z^Q \left(\frac{K}{S_0} \right) + K F_Z^Q \left(\frac{K}{S_0} \right) \\
 &= S_0 \left[F_1 \left(1 - b, 1 - b, 2 - b, 2 - b; - \left(\frac{K}{S_0} \right)^{\frac{1}{b}}, -1 \right) \right. \\
 &\quad \left. + \frac{1 - b}{2 - b} \left(\frac{K}{S_0} \right)^{-\frac{1-b}{b}} F_1 \left(2 - b, 1 - b, 2 - b, 3 - b; - \left(\frac{K}{S_0} \right)^{-\frac{1}{b}}, -1 \right) \right] \\
 &\quad + K \left[F_1 \left(1 - b, 1 - b, 2 - b, 2 - b; - \left(\frac{K}{S_0} \right)^{-\frac{1}{b}}, -1 \right) \right. \\
 &\quad \left. + \frac{1 - b}{2 - b} \left(\frac{K}{S_0} \right)^{\frac{1-b}{b}} F_1 \left(2 - b, 1 - b, 2 - b, 3 - b; - \left(\frac{K}{S_0} \right)^{\frac{1}{b}}, -1 \right) \right]
 \end{aligned}$$

A very interesting result is the price of the at-the-money two-period married put with $b = 1/2$, that is

$$MP_0(S, S_0, 2T)|_{b=1/2} = S_0 \left(\widehat{F}_Z^Q(1)|_{b=1/2} + F_Z^Q(1)|_{b=1/2} \right) = \frac{\pi}{2} S_0$$
